LINCOLN MACHINE

Manual Machining

Certain types of parts are often done more quickly on manual machines than on CNC machines. The craftsmen in our manual machining department are artisans dedicated to providing our customers with a variety of comprehensive machining services in the following areas:

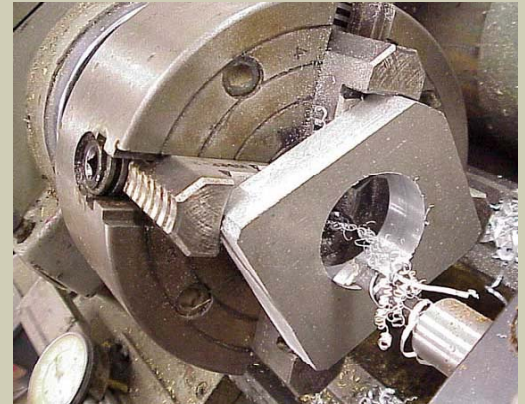

- Prototypes
- One-off piecework
- Short run production
- Modifications to your specifications of existing components
- Repairs/manufacture of the most simple to most complex of parts
- Secondary support to our CNC department

Many of your projects may involve both conventional and CNC machines to complete the various operations in the shortest amount of time and most cost effective manner. This synergistic combination has been the key to the successful completion of many large-scale projects at Lincoln Machine.

Our extensive array of manual machinery in our workshop provides the capacity to perform a variety of machining tasks onsite and benefits our customers with easier to manage projects and shorter lead times.
